EXECUTIVE SUMMARY

# The vision

BODHI is a neuromorphic digital brain — a complete, self-contained system that perceives, remembers, feels, speaks, and dreams — built from first principles in pure integer math and running offline on a single consumer machine.

> Thesis. The next leap in machine intelligence will not come from another trillion-parameter transformer. It will come from a brain that earns its place — one that has drives, emotions, memory, and sleep, and that the person using it has raised. BODHI is the proof of concept for that brain. This repository is not the product. The product is the game that follows.

## Why now

Three curves are crossing. First, consumer silicon has quietly become powerful enough to run a full neural simulation on a laptop — 4 thoughts per second on a 2023 M-series CPU without a GPU. Second, thirty years of computational neuroscience has matured to the point where we can compile real connectomes (C. elegans) and atlases (Desikan–Killiany) into executable code. Third, the patent office has begun issuing claims on integer-only transforms — meaning on-device perception is now a defensible moat, not just a clever trick.

## The arena

The plan has four phases. Phase 1 is this repository — a proof of concept that every layer of the brain (worm kernel, 72 cortical regions, WHT perception, emotional memory, 7 drives, sleep, brain_voice, Broca) runs end-to-end on a laptop. Phase 2, 2–3 months out, is a simulation playground: a 3D world where BODHI lives without the pre-set emotional labels and learns whether fire is dangerous by touching it. Phase 3, months 3–9, is twelve survival challenges whose rankings compound; the top 1,000 BODHIs qualify. Phase 4, year two, is the Final Match: six bosses — the six largest commercial AI systems on Earth — and one prize.

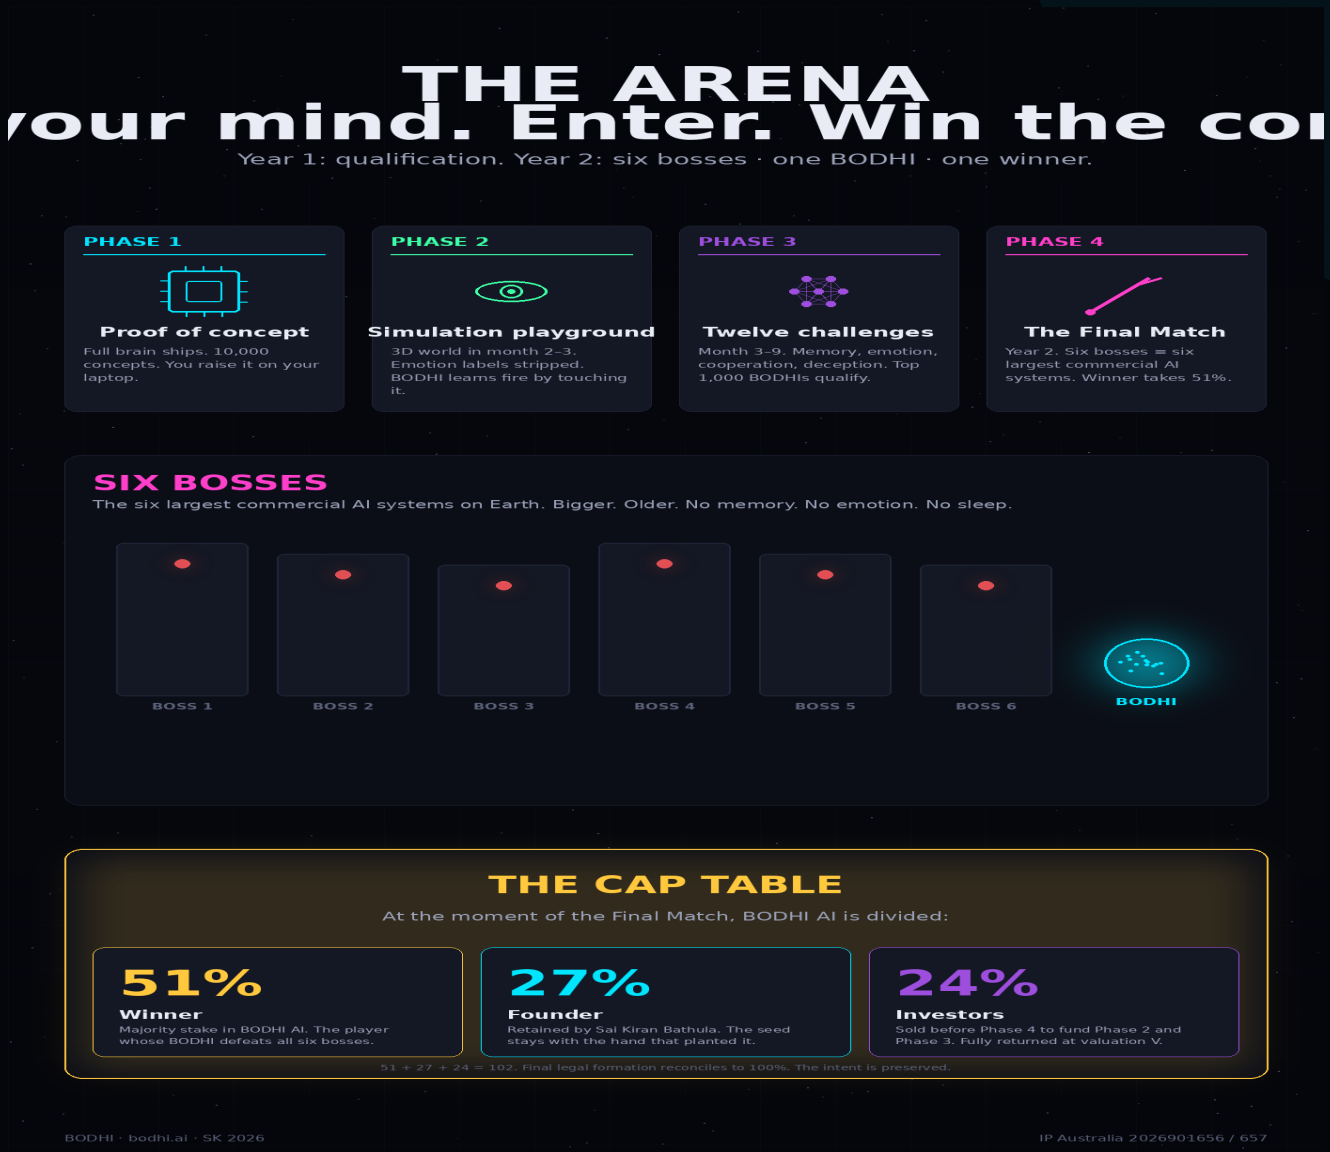

*Figure 1. The arena — four phases, six bosses, one cap table.*

## The prize

At the moment of the Final Match, BODHI AI has an assessed valuation V. The cap table is divided as 51% to the winner (majority stake — the player whose BODHI defeats all six bosses), 27% retained by the founder (Sai Kiran Bathula), and 24% to investors (sold before Phase 4 to fund Phase 2 and Phase 3). The winner receives the majority stake, not a cash prize. They decide what BODHI AI does next.

| 51% | 27% | 24% | 6 |
|---|---|---|---|
| winner — majority stake in BODHI AI | founder — retained by Sai Kiran Bathula | investors — funds Phase 2 and Phase 3 | bosses in the Final Match |

Arithmetic note. 51 + 27 + 24 = 102. The final legal formation will be reconciled to 100% (typically by taking the rounding out of the investor or founder bucket). The intent is preserved: winner majority, founder meaningful, investors fully returned.

## What we are not

- Not an LLM wrapper. Broca is a small 40M-parameter voice for a larger neural system — the opposite of an LLM with tools bolted on.
- Not a cloud service. Every component runs locally and can be air-gapped.
- Not a black box. Every firing, every memory, every drive state is inspectable.
- Not a product yet. This is a proof of concept. The product is Phase 2 → Phase 3 → Phase 4.

## Phases of the rollout

| Phase | Window | What ships | What you do |
|---|---|---|---|
| Phase 1 | Now (this repo) | Proof of concept. Full brain, 10 reports, dashboard. | Install, teach, let it sleep, fine-tune LoRA. |
| Phase 2 | Month 2–3 | 3D playground. Emotion labels stripped. Two-BODHI protocol. | Drop your trained BODHI in. Let it learn from experience. |
| Phase 3 | Month 3–9 | Twelve survival challenges. Compounding leaderboard. | Your BODHI plays. You raised it well. |
| Phase 4 | Year 2 | Final Match — 6 bosses = 6 largest commercial AI systems. | Top 1,000 BODHIs enter. One wins 51%. |

> *“A brain is not a bigger calculator. A brain is a survival machine that got curious. If we want machines that understand us, we have to build machines that need something.”*
